

Customer Order Insights & Delivery Tracker

Capstone Project 2 — Week 1 – sql

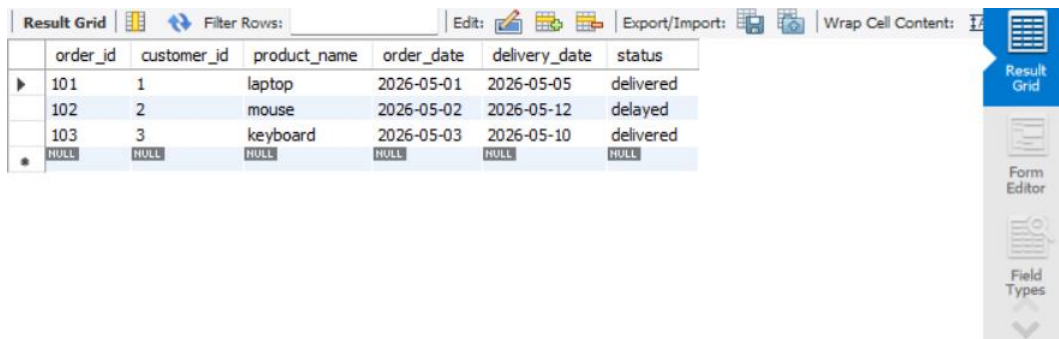

Student Name: Vaishali.S	Batch : 2
Submission Date: 14-05-2026	Week: Week 5

WEEK 1 – SQL

Objective

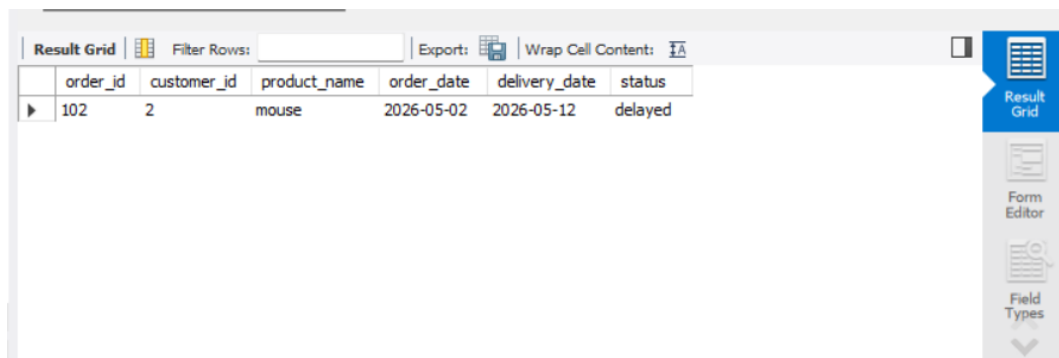

- Create mysql tables for customers, orders, and delivery_status
- Perform basic crud operations
- Create a stored procedure to fetch delayed deliveries
- Test database operations using sample records

Output

The screenshot shows a database application interface with a 'Result Grid' tab selected. The grid contains 4 rows of data. The first three rows have data, and the fourth row contains NULL values. The columns are: order_id, customer_id, product_name, order_date, delivery_date, and status.

	order_id	customer_id	product_name	order_date	delivery_date	status
▶	101	1	laptop	2026-05-01	2026-05-05	delivered
	102	2	mouse	2026-05-02	2026-05-12	delayed
	103	3	keyboard	2026-05-03	2026-05-10	delivered
*	NULL	NULL	NULL	NULL	NULL	NULL

The screenshot shows the same database application interface, but now only the second row of data is visible. This indicates that a filter has been applied to show only records with a status of 'delayed'.

	order_id	customer_id	product_name	order_date	delivery_date	status
▶	102	2	mouse	2026-05-02	2026-05-12	delayed

Conclusion

In week 1 mysql database setup was completed successfully. Tables were created, records were inserted, crud operations were tested, and stored procedure execution was verified using sample customer order data.
